

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

Faculty of
Computing

Course Code : SECD2613 Section 01
Course Name : System Analysis and Design
Lecturer : Dr Muhammad Aliff
Academic Session : 2025/2026 Semester 2
Assessment Title : Project Phase 1
Submission Due Date : 20 April 2026

Prepared by

:

Matric No.	Student Name
B22EC0071	Mohamad Azryq Haiqal Bin Mohd Rosli
A25CS0046	Bazli Abdullah Bin Mohamad Yusoff
A25CS0257	Muhamad Afif Azfar Bin Mohd Shahrizan
A25CS0255	Mikhail Adam Riaz Bin Yazmi
A25CS0179	Ahnaf Bin Zaizal

Assessment Mode

:

~~Individual~~ / Group

Feedback from Lecturer:

1.0 Introduction

The digitalisation of service-based industries has accelerated demand for intelligent, technology-driven platforms capable of managing complex transactional processes efficiently and adaptively. In the domain of property rentals and professional services, conventional systems have demonstrated significant limitations, particularly in accommodating the diverse and dynamic scheduling requirements of modern users. These legacy platforms often operate on rigid, predefined booking structures that fail to address the nuanced temporal and contextual needs of both service providers and service renters.

FlexRent is a property rental system designed with AI features and limitless flexibility bookings for users based on hourly, daily and monthly durations. The system allows users to act as both property seekers and providers, offering a seamless and intelligent rental experience. By leveraging modern technology, this system provides smart, AI-based recommendations based on keywords users use to find specific needs. Moreover, we included an AI algorithm that recommends users based on past bookings and searches.

2.0 Background Study

2.1 Organizational Background

The proliferation of on-demand digital marketplaces in recent years has fundamentally reshaped consumer expectations regarding the accessibility, convenience, and personalisation of rental and service-oriented platforms. Current property rental services such as Airbnb, PropertyGuru and Booking.com only focus on specific rental durations such as daily or monthly. This has the flaw of lacking flexibility for users who want to rent hourly, daily, or monthly in one place. Users seeking to rent a venue for a few hours while simultaneously requiring the services of a professional consultant or event specialist are compelled to navigate multiple disconnected platforms, resulting in operational inefficiency and a fragmented user experience.

FlexRent exists to break these limitations to bring all in one place while providing AI-based recommendations for users to use and AI time slot and management for providers to manage their property more easily and efficiently. Despite this growth, locally developed platforms have yet to fully leverage AI capabilities to deliver adaptive, intelligent rental experiences that respond dynamically to user behaviour and preference.

3.0 Problem Statement

Despite advancements in digital marketplace platforms, existing systems remain limited in flexibility, personalization, and efficiency. Users encounter several issues, including:

- Users struggle to find suitable options efficiently due to limited personalization
- Booking conflicts occur frequently due to poor time-slot management
- Rigid time structures that do not accommodate varying user needs
- Dependence on multiple platforms to fulfil different requirements
- Need to rely on different apps for different rental times, such as daily and monthly

These limitations result in reduced user satisfaction and inefficient resource utilization. Therefore, there is a need for an AI-integrated platform that can provide flexible booking options, intelligent recommendations, and efficient scheduling. Furthermore, FlexRent provides all in one for different time rentals.

4.0 Proposed Solution

The proposed solution is the development of FlexRent, which integrates advanced features to address the identified problems.

4.1 Technical Feasibility

The system can be developed using widely available and reliable technologies:

- Frontend: Python
- Backend: Streamlit
- Database: SQLite
- AI Techniques: Rule-based algorithm

The system will be developed using Python with the Streamlit framework, which allows rapid development of web-based applications without requiring separate frontend and backend implementations. SQLite will be used as the database due to its simplicity and ease of integration. AI functionalities will be implemented using rule-based algorithms to provide basic recommendations. This approach ensures faster development, reduced complexity, and suitability for project implementation.

4.2 Operational Feasibility

The system is designed to be user-friendly and efficient:

- Provides an intuitive interface for both seekers and providers
- Reduces manual effort through automation
- Improves booking efficiency with smart scheduling
- Enhances user satisfaction through personalized recommendations

Thus, the system is practical and can be effectively implemented in real-world environments.

4.3 Economic Feasibility

The benefits significantly outweigh the costs, making the project economically viable

Costs	Benefits
Development and implementation	Increased efficiency in managing bookings
System maintenance and hosting	Improved user experience and satisfaction
Training and support	Potential for scalability and business growth
	Reduction in operational inefficiencies

5.0 Objectives

The objectives of the proposed systems are:

- To develop a flexible property rental system supporting hourly, daily, and monthly usage.
- To integrate AI for personalized recommendations and smart scheduling.
- To reduce booking conflicts through efficient time management
- To create a unified platform for property rentals
- To enhance overall system usability and efficiency

6.0 Scope of The Project

Based on the discussions conducted, certain features or system components will be developed within the project scope, while others will be identified as falling outside the project coverage.

In Scope

The following are included in the project:

Users

The system will serve the following user groups:

- Renters
- Property provider

Platform

The main deliverable of the project will be a web-based application, with the possibility of developing a mobile application as a future extension.

Key Features

- Smart Schedulers
- Smart Matching
- Flexible schedule system (hourly, daily, monthly and yearly rental)
- Geospatial Proximity Search System
- Property analytics and comparison system
- Rent Budget Comparison system
- Resource Booking System (RBS)

Out of Scope

The following components are excluded from this project:

- Physical properties maintenance - Facilities maintenance and repair of the rental unit are not within the current project scope.
- Furniture rental - It is a separate supply chain and inventory business model that sits apart from the digital booking or matching process.
- Conflict management - These fall outside our software's scope, as it requires legal expertise and compliance with local regulations
- Utility management & billing - this involves external utility companies and complex billing cycles that are often kept separate from the base rent or booking fee

7.0 Project Planning

7.1 Human Resource

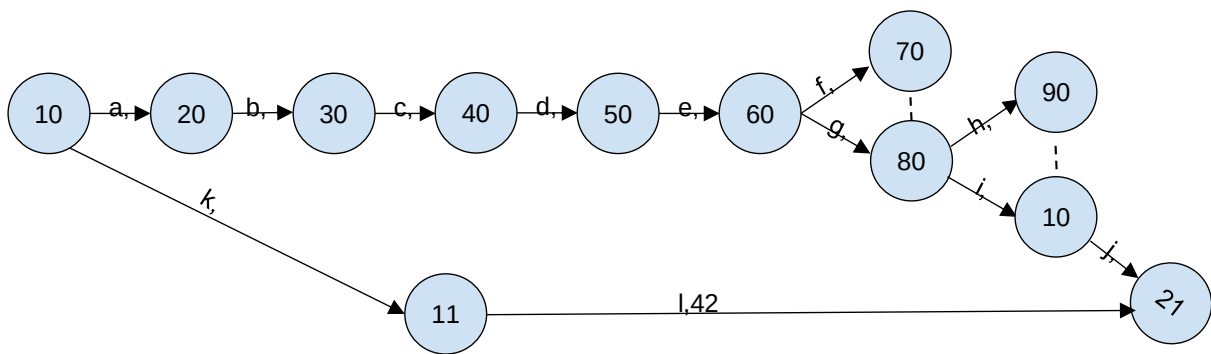

Role	Responsibility	Primary Deliverables
Project Manager	Monitors the project timeline, manages the GitHub Kanban board, and ensures team communication and task completion.	Gantt Chart, PERT Chart, GitHub Management.
System Analyst	Conducts background research and defines the system requirements, specifically the "buffer time" logic for hourly rentals.	Problem Statement, Objectives, Requirement Specs.
AI Specialist	Designs the logic for the AI features and the data flow between system components.	Data Flow Diagrams (DFD), AI Logic Flow.
UI/UX Designer	Designs the user interface for both Seekers and Providers, ensuring a seamless booking experience.	High-Fidelity Figma Prototype.
AI Specialist	Designs the structure for storing property data, user roles, and AI metadata.	Entity Relationship Diagram (ERD).

7.2 Work Breakdown Structure (WBS)

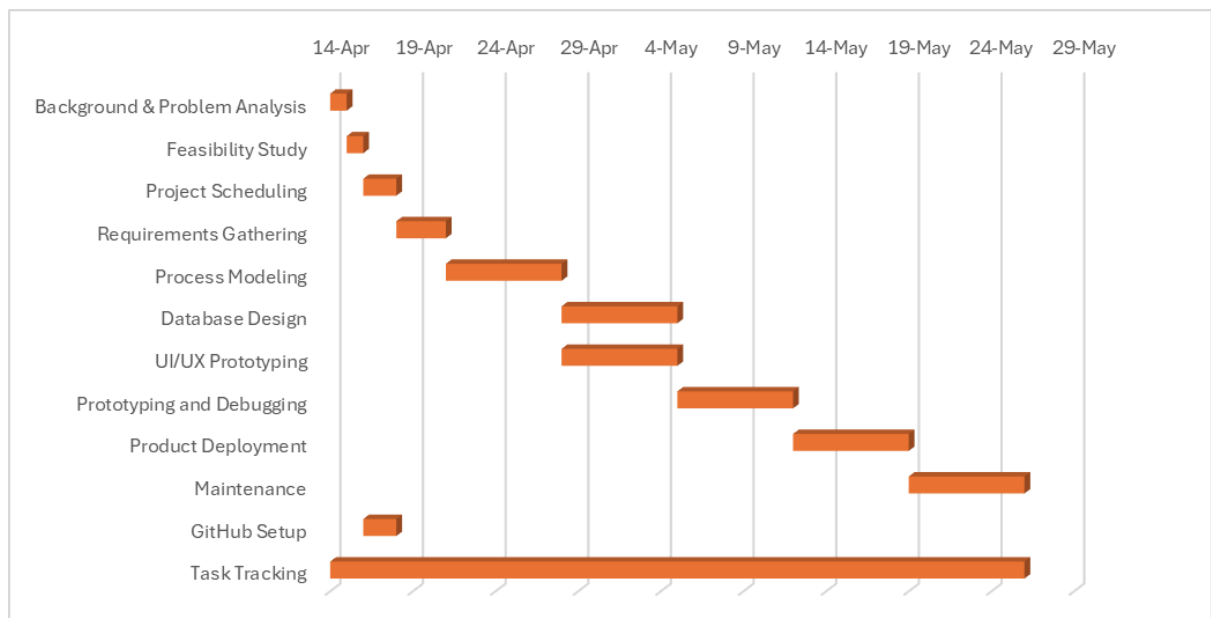

Phase ID	Phase	Activity	Predecessor	Duration (Days)	Date
a	Background & Problem Analysis	Conduct organizational study and define the problem statement.		1	14/4
b	Feasibility Study	Perform Technical, Operational, and Economic (CBA) analysis.	a	1	15/4
c	Project Scheduling	Create WBS, PERT, and Gantt charts.	b	2	16/4

d	Requirements Gathering	Define Functional and Non-Functional requirements.	a, b, c	3	18/4
e	Process Modeling	Create Context Level and Level 0 DFDs showing AI and booking logic.	d	7	21/4
f	Database Design	Create an ERD supporting units of measure (Hour/Day/Month) and AI metadata.	e	7	28/4
g	UI/UX Prototyping	Build a high-fidelity, interactive Figma prototype for Seekers and Providers.	f	7	28/4
h	Prototyping and debugging	Conduct tests on prototype to ensure no errors occur before the final product	f,g	7	5/5
i	Product deployment	Deploy finalised product to production server	g	7	12/5
j	Maintenance	Update system regularly based on user complaints	i	7	19/5
k	GitHub Setup	Initialize repository and invite team/lecturer.		2	16/4
l	Task Tracking:	Manage the Kanban board and perform weekly progress updates.	k	42	14/4

7.3 PERT Chart

7.4 Gantt Chart

8.0 Benefits and Overall Summary of Proposed System

FlexRent presents a comprehensive and innovative solution to the limitations of existing property rental platforms. By integrating AI capabilities with flexible booking systems, it enhances efficiency, reduces operational challenges, and improves user satisfaction.

The system is technically feasible, operationally practical, and economically beneficial, making it a strong candidate for implementation in real-world scenarios. Its scalable design also allows for future enhancements, ensuring long-term relevance and adaptability.
